

Sleep

Sleep

Adequate sleep is important for your teen's overall health. Tips for healthy sleep:

- **Be active during the day:** it is recommended your teen have at least 60 minutes of physical activity daily
- **Monitor screen time:** to prevent sleep disruption, turn off all screens at least 1 hour before bedtime. Create a family media plan and set consistent boundaries about usage
- **Create a supportive and safe sleep environment**
 - Dim the lights
 - Control the temperature
- **Understanding teens require more sleep.** The American Academy of Sleep Medicine recommends teens get 8-10 hours of sleep per night, but it is common for the average teen to get 7 hours or less per night.
- **Avoid overscheduling.** Take time to wind down and allow your teen the downtime they need.

What are some factors that prevent teens from getting enough sleep?

- **Shifting of the biological clock.** After puberty, a teen's internal clock shifts about 2 hours. For example, if a teen fell asleep by 9 pm before, they are now typically not tired until after 11 pm. This also means that they naturally will want to sleep 2 hours later the following morning.
- **Early school start times.** Most school districts start classes as early as 7 am, which means teens have to get up as early as 5 am to get ready and make it to school on time.
- **Having a busy social life.** Most teens partake in afterschool activities such as clubs, sports, part-time jobs, or household chores on top of the homework they are assigned daily and must be completed each evening. Socializing also

What is affected by not getting enough sleep?

- **Mood.** Not getting enough sleep can cause teens to be irritable and moody all day. Controlling their moods can be an issue and they can find themselves frustrated or upset more easily.
- **Behavior.** Teens who are not getting enough sleep are more prone to risk-taking behaviors such as drinking alcohol and driving recklessly.
- **Thinking.** Sleep deprivation can result in attention problems, memory problems, lead to poor decision-making, slow down reaction time and stunt creativity. These are all important for academic success.
- **Academic performance.** Teens who are sleep deprived are more likely to perform poorly in school, fall asleep during class, have multiple school absences and/or be consistently tardy.
- **Athletic performance.** Sleep deprived teens are more likely to perform poorly in after-school activities/sports due to slower reaction times.
- **Driving.** Teens are the most prone to fall asleep while behind the wheel. This can be highly dangerous, especially combined with other negative effects such as slower reaction times and being easily distracted.

Sleep

What can I do?

- **Keep track of sleep patterns and schedules.**
- **Maintain a regular sleep schedule.** Teens should be going to bed and waking up around the same time every day, including non-school nights. Try to keep the difference in sleep and wake times within one hour.
- **Be consistent on weekends.** Although teens can stay up a little longer, they should not sleep in to catch up on sleep they missed during the week. It will make it harder to get back on track for their regular schedule.
- **Create a sleep-friendly physical environment.**
- **A comfortable, cool, quiet, and dark bedroom.** A bedroom that is warmer than 75 degrees can make it harder to fall, and stay, asleep.
- **The bed should only be used for sleeping.** Try not to have your teen complete their homework, read a book, or listen to music in bed.
- **Keep a consistent bedtime routine.** Try to help your teen “wind down” by doing less than stimulating activities such as reading or listening to calm music. Do not use this time to watch television, cram in more studying, use the computer, talk on the phone, or exercise.

Additional important tips:

Try to:

- **Incorporate exercise into a daily routine.** It may help to fall asleep more easily and sleep more deeply.
- **Take a break and go outside for some time every day, especially in the morning.** Getting sun exposure helps the body keep its internal clock on track.
- **Eat meals regularly and avoid going to bed on an empty stomach.** However, do not eat a full meal an hour before bed, instead try to opt for a light snack.

Avoid:

- **Caffeine.** Avoid consuming caffeine, (soda, coffee, tea, energy drinks, chocolate, etc.), in the late afternoon or evening.
- **Alcohol.** Alcohol is not only bad for overall health, but it also disrupts sleep. This could lead to night awakenings.
- **Smoking.** Smoking also disrupts sleep. It is best for your overall health not to smoke at all but try not to smoke for at least an hour before bedtime if you do.
- **Sleeping pills.** Do not use sleeping pills or other over-the-counter sleep aids. They can potentially be dangerous, and you may depend on them once your sleep problems return.
